/garzik/lumberjack-13.04.tar.gz to the path of the spigot but how? guest_35587: the "layers" (i.e. sub-directories) are the same as for a typical package: for example, "lumberjack-13.04" contains "releases" "downloads" "docs" "etc" ok thank you that was helpful base, headers, build-essential, kernel-headers, image, source, build, python, etc. etc guest_35587: see for "PPA Build dependencies" guest_35587: building inside a container is probably going to be more complicated Hi! I'm having issues with upgrading to 15.10. After the reboot, the update does not find any updates I can see the updates in the update manager, but it won't download them. I'm using a command-line with the default updates settings. Any ideas on what could be causing this? ZoderUck: "sudo apt-get update" "sudo apt-get upgrade" ZoderUck: and if that works as expected then "sudo apt-get dist-upgrade" I will try that. Thanks! Let me know. I didn't even get past the "gathering information about your system" step.

ZoderUck: You're using the command-line, rather than using the GUI Update Manager? That's part of the problem right there
TJ-: Oh, that was just a typo. It was literally command-line. I was trying to type "sudo apt-get update && sudo apt-get upgrade"
but it didn't work
